

EVERCRAFTED

Motion Engine

How to Use Guide

Transform your wreath renders into living, breathing animations.

Atelier Tier

evercrafted.com

INTRODUCTION

What is Motion Engine?

Motion Engine is an Atelier-exclusive tool that transforms your static wreath renders into emotion-driven animated video outputs. Upload any finished render, choose how it should move, and export a frame sequence ready for Etsy listings, client portal previews, and social media.

The engine uses three motion types — Sway, Rotation, and Pulse — each mapped to a named intensity profile that corresponds to the emotional intent of your design. An AI layer can detect emotion automatically from a description, or generate a full motion brief from your blueprint genome string.

SYSTEM PIPELINE

Motion Engine is the fifth stage in the Evercrafted pipeline — it takes your finished render and adds the final emotional dimension.

ATELIER

Motion Engine is exclusive to the Atelier tier. Studio subscribers have access to canvas preview and frame export, but not AI features or the Statement profile.

BEFORE YOU START

What You'll Need

01 A finished wreath render

PNG, JPG, or WebP image. Minimum 800 x 800px recommended. Outputs from the Evercrafted Prompt Compiler or Midjourney StyleSync work perfectly.

02 An Atelier subscription

For full AI features, Statement profile, GIF export, and Pulse motion type. Studio subscribers can use Sway, Rotation, Whisper, and Breeze.

03 A modern browser

Motion Engine runs entirely in-browser using the HTML5 Canvas API. No installation required — just open and use.

STEP-BY-STEP GUIDE

Using Motion Engine

01

Upload Your Render

Click the upload zone or drag and drop your render image directly onto it. Accepted formats: PNG, JPG, WebP. Once loaded, a preview thumbnail appears and the canvas displays your image ready for animation.

Tip: For the best results, use a square render at 1080 x 1080px. The canvas will scale any aspect ratio automatically.

02

Choose a Motion Profile

Select one of three named profiles: Whisper (30), Breeze (60), or Statement (90). Each profile sets the intensity and maps to a specific emotional intent. Selecting a profile auto-applies the intensity value to all sliders.

Statement profile requires Atelier tier. It will show a lock icon on Studio plans.

03

Run Emotion Auto-Detect (Atelier)

Type a description of your design's emotional intent into the Emotion Auto-Detect field and click Detect and Map. Claude AI will analyze your input and automatically apply the most appropriate profile, motion type, and intensity setting.

Examples: "calm and minimal", "romantic and soft", "dramatic holiday statement"

04

Select a Motion Type

Choose from three motion types using the tab buttons: Sway (natural lateral movement), Rotation (full 360 degree spin with depth shadow), or Pulse (scale-based breathing effect). The motion wave preview updates in real time to show the curve shape.

Pulse type requires Atelier tier. Sway and Rotation are available to Studio and above.

05

Configure Intensity, Duration, and FPS

Use the three sliders to fine-tune your animation. Intensity controls the amplitude and rotation factor of the motion. Duration sets how many seconds the full animation runs. Frame Rate controls smoothness: 15fps is suitable for GIFs, 30fps for MP4.

The frame count preview updates live: $\text{Duration} \times \text{FPS} = \text{total frames to generate}$.

06

Set Background Color

Choose from Off-white (default Evercrafted paper tone), Pure White, Black, or Transparent. Off-white is recommended for Etsy listings. Black works well for social media reels. Transparent produces a PNG sequence with alpha channel.

07

Generate the Animation

Click Generate Animation. A progress bar shows frame generation in real time. Once complete, the frame strip appears below the canvas and the export panel unlocks. Click Play Preview to watch the full animation loop at your selected frame rate.

Generation time depends on frame count. A 10-second 30fps animation produces 300 frames and typically completes in a few seconds.

08

Export Your Output

Three export options are available in the Export tab: Frame Sequence downloads PNG keyframes you can import into any video editor or FFmpeg. GIF Export (Atelier) produces a preview-ready animated GIF. The FFmpeg tab shows the exact terminal command to compile your frames into MP4.

MOTION PROFILES

The Three Profiles

Motion profiles map emotional intent to physical parameters. Each profile sets a specific amplitude, rotation factor, and intensity value — so your animation always reflects the feeling of the design, not just an arbitrary setting.

■ Whisper

CALM · SUBTLE · MINIMAL

A barely-there sway — like a wreath catching a breath of air. For minimalist designs and neutral palettes.

Amplitude	5p
Rotation	1 de
Emotion map	calm

■ Breeze

BALANCED · NATURAL · DEFAULT

The default profile. Fluid, organic movement that showcases sculptural depth without overpowering.

Amplitude	12p
Rotation	3 de
Emotion map	balance

■ Statement

DRAMATIC · BOLD · EDITORIAL

Maximum physical presence. For grand seasonal centerpieces and Atelier originals. Requires Atelier.

Amplitude	25p
Rotation	6 de
Emotion map	dramatic

MOTION TYPES

Sway · Rotation · Pulse

Sway	Studio+	Natural lateral movement with subtle rotation. The primary motion type — feels weighted and physical. Formula: $x = \sin(t) \times \text{amplitude}$, $\text{rotation} = \sin(t) \times \text{rotation_factor}$.
Rotation	Studio+	Simulated 360 degree spin with a depth-illusion shadow layer. Best for product showcases. Formula: $\text{angle} = \text{frame} \times (360 / \text{total_frames})$.
Pulse	Atelier	Scale-based breathing effect — subtle expansion and contraction. Best for romantic and soft designs. Formula: $\text{scale} = 1 + \sin(t) \times \text{intensity_factor}$.

AI FEATURES · ATELIER

Emotion Auto-Detect & Motion Brief

Motion Engine includes two AI-powered features powered by Claude. Both are exclusive to the Atelier tier and accessible directly from the app interface.

Feature	How to Use	Output
Emotion Auto-Detect	Type an emotion or mood description (e.g. "calm", "dramatic winter") into the Emotion field and click Detect and Map.	Automatically applies the matched profile, motion type, and intensity to your session.
Motion Brief Generator	Paste a blueprint ID, genome string, or free-text design description into the Brief field and click Generate Brief.	Returns emotion mapping, recommended profile and type, intensity, Etsy use guidance, social use guidance, and a 3-shot shot list.

EXPORT

Getting Your Animation Out

Format	Tier	Best For	How
Frame Sequence (PNG)	Studio+	Video editors, custom MP4 compilation	Export tab > Frame Sequence button. Downloads up to 10 keyframe PNGs.
GIF	Atelier	Etsy listing thumbnails, client portal embeds	Export tab > Export GIF button.
MP4 (via FFmpeg)	Studio+	Instagram Reels, Shopify product video	FFmpeg tab > Copy Command. Run locally with your frame sequence.
Config JSON	Studio+	Save and reproduce exact animation settings	Config JSON tab > Copy JSON. Store with your blueprint files.

NOTE

True GIF encoding and MP4 compilation happen outside the browser. The GIF export downloads a high-quality PNG frame as a proxy. For MP4, use the provided FFmpeg command after downloading your frame sequence.

PRO TIPS

Getting the Best Results

RENDER SIZE

Use square renders at 1080 x 1080px for the best output quality. The canvas scales any image but square crops work best for all export formats.

EMOTION FIRST

Before adjusting sliders manually, try the Emotion Auto-Detect with a 2-3 word description. The AI mapping is often more accurate than manual tuning for conveying the right feeling.

ETSY LISTINGS

Breeze profile + Sway type + 8-10 second duration produces the best Etsy listing animation. Keep it subtle — buyers should notice the movement, not be distracted by it.

INSTAGRAM REELS

Statement profile + Rotation type + 15 seconds at 30fps compiled to MP4 via FFmpeg performs well as a reel. Use the black background for maximum visual impact.

CLIENT PORTAL

Save the Config JSON after every animation you generate. This lets you reproduce exact settings for a client revision without starting from scratch.

MOTION BRIEF

Paste your blueprint genome string directly into the Motion Brief generator for the most precise emotional mapping. The AI reads the encoded design intent from the genome.

TROUBLESHOOTING

Common Questions

Q The canvas shows a blank gray area after upload.

Confirm your image is PNG, JPG, or WebP format and is not corrupted. Try a different browser if the issue persists. The minimum recommended size is 800 x 800px.

Q Statement profile or Pulse type are locked.

These features require the Atelier tier. The tier simulator bar (in the prototype) lets you preview how the app looks at different subscription levels. Upgrade your plan to unlock.

Q The Emotion Auto-Detect or Motion Brief buttons are missing.

These AI features are Atelier-exclusive. If you are on a lower tier, they will show a blurred overlay with an upgrade prompt rather than disappearing.

Q Animation generation is slow or freezes the browser.

High frame counts (duration x fps over 600 frames) are CPU-intensive. Try reducing duration to 8 seconds or fps to 15 for GIF export. Long MP4 animations are best compiled server-side via FFmpeg.

Q The FFmpeg command does not produce an MP4.

Ensure your frame files are named in the correct sequence format (ec-frame-0000.png, ec-frame-0001.png...) and that FFmpeg is installed. Run `ffmpeg -version` in your terminal to confirm.

Q My downloaded GIF is just a single PNG.

True GIF encoding requires server-side processing. The current client export downloads a high-quality PNG frame as a proxy. For animated GIF output, use FFmpeg with a palette pass: see the Evercrafted developer documentation.
